Document version: 1.0, June 19, 2015
SENSOR NAME: WET Labs VSF
S/N: 128g

1) Introduction and Summary

The WET Labs VSF is a scattering sensor. It measures the volume scattering function (VSF) at 528 nm and 3 angles. It has a single detector and three light emitting diodes (LEDs) oriented at three different angles in relation to the detector, with path lengths that vary according to the angle. The specific characteristics are listed below:

Specification	
Wavelength, λ (nm):	528
Angle, θ (deg):	104, 130, 151
Path length, l (m):	0.026, 0.023, 0.027

2) Calibration/Maintenance

2.1) Manufacturer calibrations/coefficients

The calibration applied to this data set was performed on June 10, 2014 at WET Labs, Inc. research department in Narragansett, RI. It was done using 0.1 μm NIST-traceable polystyrene microspheres. The results of this calibration are shown below:

Wavelength–Angle	Scaling Factor	Dark Offset
$\lambda = 528 \text{ nm} - \theta = 104^\circ$	1.25791e-05	58.4
$\lambda = 528 \text{ nm} - \theta = 130^\circ$	7.64091e-06	53.4
$\lambda = 528 \text{ nm} - \theta = 151^\circ$	3.52802e-06	52.3

2.2) Self calibration methods and results

The WET Labs VSF does not require field calibration.

3) Deployment

3.1) Measurement methods

Measurements were made with this instrument at each station. All measurements were made in the same manner.

3.2) Package design

This instrument was attached to the instrument cage in a location that was protected from “seeing” any part of the cage or other instruments. It was connected to a WET Labs DH-4 that acted as power distributor and data collection device. The package was powered through the DH-4 by batteries.

4) Data processing

4.1) Data analysis

Data processing began by binning the raw data to 1 m depth bins by averaging all points occurring within that bin. Further processing of the VSF data required the corresponding temperature and salinity values from the CTD and the absorption and scattering coefficients of Gelbstoff + particles from the ac-9 S/N ac90271. All calculations are performed for each of the 3 angles. The processing steps and the equations used are listed below:

1. The scattering coefficient and volume scattering function of water, b_w and VSF_w , were calculated^{1,2} for the measured water temperature and salinity and included in the data set as vsf0128g_bw and vsf0128g_VSFw.
2. The fully corrected absorption coefficient of Gelbstoff + particles, a_{gp} , and the scattering coefficient of particles, b_p , from ac90271 were interpolated to match the wavelengths of vsf0128g and included in the data set as vsf0128g_agp and vsf0128g_bp.
3. The dark offsets obtained in the secondary cast were applied to the raw counts to obtain the corrected data, the scaling factors were applied, and the interpolated values of a_{gp} were used to correct for absorption along the path to obtain the total volume scattering function. This is included in the data set as vsf0128g_VSF.

$$VSF = ((counts - dark) * scaling_factor) * e^{(\ell + a_{gp})}$$

4. The calculated volume scattering function of seawater, VSF_w , was subtracted from the total volume scattering function, VSF, to obtain the volume scattering function of particles, VSF_p , which is included in the data set as vsf0128g_VSFp.

$$VSF_p = VSF - VSF_w$$

5. The volume scattering function of particles, VSF_p , was integrated using the trapezoidal method of the angles (x) in the backwards direction (90° to 180°) to obtain the backscattering coefficient of particles, b_{bp} , which is included in the data set as vsf0128g_bbp.

$$b_{bp} = 2\pi \int_{90^\circ}^{180^\circ} \sin(x) VSF_p dx$$

6. One half of the calculated scattering coefficient of seawater, b_w , was added to the backscattering coefficient of particles, b_{bp} , to obtain the total backscattering coefficient, b_b , which is included in the data set as vsf0128g_bb.

$$b_{bt} = b_{bp} + \frac{1}{2} b_w$$

7. The backscattering coefficient of particles, b_{bp} , was divided by the scattering coefficient of particles, b_p , to obtain the backscattering ratio, which is included in the data set as vsf0128g_bbp_bp.

4.2) Quality control

Processed data was reviewed by eye for any evidence of contamination by bubbles or potential interference from the instrument package and suspect data was replaced with a null value.
